

Interferon- γ (IFN- γ), human recombinant

CATALOG #: 4116-20 20 μ g
 4116-100 100 μ g
 4116-1000 1 mg

SOURCE: *E. coli*

PURITY: >98% by SDS-PAGE and HPLC analysis
 Endotoxin level is <0.1 ng per μ g of IFN- γ .

MOL. WEIGHT: 16.9 kDa

FORMULATION: Lyophilized powder with no additive

RECONSTITUTION: Centrifuge the vial prior to opening. Reconstitute in sterile water to a concentration of 0.1-1 mg/ml.

STORAGE CONDITIONS: The lyophilized IFN- γ should be stored desiccated below 0°C. Reconstituted IFN- γ should be stored at working aliquots at -20°C. For long term storage, it's recommend to add a carrier protein (0.1% HAS or BSA).

DESCRIPTION: IFN- γ is a lymphoid factor that possesses potent anti-viral activity. Interferon-gamma (IFN- γ /IFNG) is a dimerized soluble cytokine that is the only member of the type II class of interferon. This interferon was originally called macrophage-activating factor, a term now used to describe a larger family of proteins to which IFN- γ belongs. IFN-gamma has been used in a wide variety of clinical indications. Interferon-gamma (IFN gamma) is a central regulator of the immune response and signals via the Janus Activated Kinase (JAK)-Signal Transducer and Activator of Transcription (STAT) pathway. Interferon gamma has broader roles in activation of innate and adaptive immune responses to viruses and tumors, in part through upregulating transcription of genes involved in cell cycle regulation, apoptosis, and antigen processing/presentation. Despite this, rodent and human trophoblast cells show dampened responses to IFNG that reflect the resistance of these cells to IFNG-mediated activation of major histocompatibility complex (MHC) class II transplantation antigen expression. Recombinant human IFN- γ is a 16.9 kDa protein containing 144 amino acid residues.

BIOLOGICAL ACTIVITY:

The ED₅₀ as determined in a viral resistance assay is \leq 0.05 ng/ml, corresponding to a specific activity of $\geq 2 \times 10^7$ units/mg.
