BACKGROUND:

BMPs (bone morphogenetic proteins) belong to the TGF-beta superfamily of structurally related signaling proteins. Members of this superfamily are widely represented throughout the animal kingdom and have been implicated in a variety of developmental processes. Proteins of the TGF-beta superfamily are disulfide-linked dimers composed of two 12-15 kDa polypeptide chains. As implied by their name, BMPs initiate, promote and regulate bone development, growth, remodeling and repair. BMP-7 has been indicated to induce cartilage formation.

APPLICATIONS:

The antibody can be used for Western blotting (1-4 µg/ml). However, the optimal conditions should be determined individually.

USAGE: For Research Use Only. Not to be used in human.
