<b>DESCRIPTION:</b>	Insulin is important in stimulating the uptake of glucose from blood in the skeletal muscle and adipose tissue. It is secreted by pancreatic β cells through a glucose sensing pathway. Insulin also increases cell permeability to monosaccharides, amino acids and fatty acids. Insulin is first formed as a precursor molecule, preproinsulin which is then processed into proinsulin and finally to the mature insulin hormone. A mature form of insulin has an A chain and a B chain that are connected by two disulfide bonds. Defects in insulin are the cause of type-II diabetes mellitus.
<b>APPLICATION:</b>	Western blot: 0.5-4 µg/ml  <b>Note: This information is only intended as a guide. The optimal dilutions must be determined by the user.</b>
