Introduction:
Glutathione (GSH) is the major intracellular low-molecular-weight thiol that plays a critical role in the cellular defense against oxidative stress in mammalian cells. BioVision’s ApoGSH™ Glutathione Colorimetric Assay Kit provides a convenient, colorimetric method for analyzing either total glutathione or the reduced form glutathione alone using a microtiter plate reader. The assay is based on the glutathione recycling system by DTNB and glutathione reductase (Fig. 1). DTNB and glutathione (GSH) react to generate 2-nitro-5-thiobenzoic acid which has yellow color. Therefore, GSH concentration can be determined by measuring absorbance at 412 nm. The generated GSSG can be reduced back to GSH by glutathione reductase, and GSH reacts with DTNB again to produce more 2-nitro-5-thiobenzoic acid. Therefore, the recycling system dramatically improves the sensitivity of total glutathione detection. The kit includes the 5-Sulfosalicylic acid (SSA) for the removal of proteins from samples and for the protection of GSH oxidation and γ-glutamyl transpeptidase reaction. The kit can quantify glutathione from 1-100 ng/well in a 200 µl reaction. For detecting lower glutathione concentrations, such as in blood samples, increasing reaction time will generate stronger signal. The kit can also specifically detect glutathione reductase from the recycling system) is 100 times lower than detecting the total reaction mixture. The sensitivity for detecting the reduced form of glutathione (without the reduced form of glutathione (GSH) reaction can be increased by omitting the glutathione reductase reaction. The kit can quantify glutathione from 1-100 ng/well in a 200 µl reaction. For detecting lower glutathione concentrations, such as in blood samples, increasing reaction time will generate stronger signal. The kit can also specifically detect glutathione reductase from the recycling system) is 100 times lower than detecting the total reaction mixture. The sensitivity for detecting the reduced form of glutathione (without the reduced form of glutathione (GSH) reaction can be increased by omitting the glutathione reductase reaction.

III. Sample Preparation:
Note: Peptide thiol may interfere with the assay of reduced form glutathione. SSA treatment may not able to complete remove all small peptides from samples. Further purification may be required to accurately measure reduced form glutathione. Peptide thiol’s don’t significantly interfere with total glutathione assay.

A. Cell Sample Preparation (0.5-1 x 10⁶ cells/assay)
2. Collect cells by centrifugation at 700 x g for 5 minutes at 4 °C. Remove supernatant.
3. Resuspend cell pellet in 0.5 ml ice-cold PBS. Transfer into a 1.5 ml microcentrifuge tube, and centrifuge at 700 x g for 5 minutes at 4 °C. Remove supernatant.
4. Lyse cells in 80 µl ice-cold Glutathione Buffer. Incubate on ice for 10 minutes.
5. Add 20 µl of 5% SSA (see below for SSA preparation), mix well and centrifuge at 8000 x g for 10 min. Transfer supernatant to a fresh tube and use it for glutathione assay.

B. Tissue Sample Preparation (100 mg)
1. Homogenize the tissue in 0.4 ml of Glutathione Buffer.
2. Add 100 µl of 5% SSA (see below for SSA preparation), mix well, and centrifuge at 8000 x g for 10 minutes.
3. Transfer supernatant to a fresh tube and use it for glutathione assay.

C. Plasma Sample Preparation
1. Centrifuge an anticoagulant treated blood at 1000 x g for 10 min at 4 °C.
2. Transfer the plasma layer to a new tube and add 1/4 vol of 5% SSA Mix well.
3. Centrifuge at 8000 x g for 10 min at 4 °C.
4. Transfer supernatant to a new tube, and use it for the glutathione assay.

D. Erythrocyte Sample Preparation
1. Centrifuge an anticoagulant treated blood at 1000 x g for 10 min at 4 °C.
2. Discard the supernatant and the white buffy layer.
3. Lyse the erythrocytes with 4 vol of Glutathione Buffer. Keep on ice for 10 min.
4. Add 1 vol 5% SSA, mix well, and centrifuge at 8000 x g for 10 minutes. Transfer supernatant to a fresh tube and use it for glutathione assay.

Note: Erythrocytes can be isolated from the remaining sample solution after the plasma sample isolation.

IV. Preparation of Solutions & Storage Conditions:
Substrate: Add 1 ml of Glutathione Buffer to 1 vial of substrate and dissolve it completely. Store the remaining solution at −20 °C, stable for 2 months.

NADPH Generating Mix: Add 1 ml of Glutathione Buffer to 1 vial of the NADPH mix. Store the solution at −20 °C, stable for 2 months.

Glutathione Reductase: Add 1 ml of Glutathione Buffer to 1 vial of the enzyme and dissolve. Store the solution at −20 °C, stable for 6 months.

SSA: Add 19 ml of dH₂O to make 5% solution and then dilute 5 ml of the solution with Glutathione Buffer to make 1% SSA solution. Store at 4 °C, stable for 6 months.

GSH Standard: Add 1 ml of 1% SSA to the GSH standard vial to generate 1µg/µl GSH standard solution. Store at −20 °C, stable for 2 months.
V. Preparation of Solutions for Standard Curve:
To generate standard curve for detecting the reduced form of glutathione only, add 50, 40, 30, 20, 10, and 0 µl of the 1 µg/µl GSH standard into each labeled microcentrifuge tubes, add 1% SSA to make up for a total volume of 100 µl/tube.
To generate standard curve for detecting the total glutathione, dilute the 1 µg/µl glutathione solution into 10 ng/µl with 1% SSA. Add 50, 40, 30, 20, 10, and 0 µl of the 10 ng/µl GSH standard into each labeled microcentrifuge tubes, add 1% SSA to make up for a total volume of 100 µl/tube.

VI. Glutathione Assay Protocol:
1. Prepare enough Reaction Mix for the standard and samples to be assayed in 96-well plate (not provided). Each well should contain:
   - 20 µl NADPH Generating Mix
   - 20 µl Glutathione Reductase
   - 120 µl Glutathione Reaction Buffer
   
   *For detecting the reduced form of glutathione only, omit Glutathione Reductase. Use 20 µl of the Glutathione Reaction Buffer replace the 20 µl of glutathione Reductase.

2. Mix well. Add 160 µl of the Reaction Mix to each well and incubate at room temperature for 10 minutes to generate NADPH.
3. Add 20 µl of either the GSH standard solutions or the sample solution. Incubate the plate at room temperature for 5-10 min.
   
   **Note:** We recommend to make several dilutions of your sample using the 1% SSA to make sure the readings are within the range of the standard calibration curve.

4. Add 20 µl of Substrate solution, and incubate at room temperature for 5-10 min, or longer if the samples contain low levels of glutathione.
5. Determine concentrations of GSH in the sample solutions using the standard glutathione calibration curve.
   
   **Note:** A. Using reduced form glutathione Standard Curve for detecting reduced form of glutathione. Using total Glutathione Standard Curve for detecting total glutathione. There are about 10 to 100 fold difference in detection sensitivity between detecting reduced form glutathione and total glutathione (see procedure step IV for preparation of standard curve).
   
   B. The colorimetric reaction is stable and the O.D. increases linearly over 30 min for total glutathione detection.

VI. Calculation of Total Glutathione
Pseudo-end point method:  
Total Glutathione = (O.Dsample - O.Dblank)/SlopeSTD Curve

Kinetic method:  
Total Glutathione = (SlopeSample - Slopeblank)/SlopeSTD Curve

VIII. Reagent Interference
Reducing agents such as ascorbic acid, β-mercaptoethanol, dithiothreitol (DTT) and cysteine, or thiol reactive compounds such as maleimide compounds, interfere with the glutathione assay and therefore should be avoided during the sample preparation.

When detecting the reduced form of glutathione, protein thiol can generate significant background signal. In such cases, it is necessary to completely remove proteins from samples. We suggest using Centrifugal Spin column with 10 kDa molecular weight cut off filter (BioVision, Cat. No. 1997-25) to remove proteins. Then the reduced glutathione can be easily detected from spin through samples.

**Fig. 2. Glutathione Standard Curve.** Various amounts of standard glutathione was added to the glutathione reaction and incubated for 10 min according to the kit instructions. Absorbance was measured at O.D. 405 nm.
