β-Secretase (BACE1) Activity Assay Kit II (Fluorometric)

(Catalog # K388-100; 100 assays; Store at -20°C)

I. Introduction:
β-Secretase (EC 3.4.23.46), also called BACE1 (β-site of APP cleaving enzyme) or memapsin-2 (membrane-associated aspartic protease), is an aspartic-acid protease. Along with γ-secretase, BACE1 cleaves the APP (Membrane-anchored amyloid precursor protein) and generates soluble amyloid-β (Aβ). Accumulation of Aβ is the key event for pathogenesis of Alzheimer’s disease, thus monitoring and targeting BACE1 activity are important for the study and development of therapeutic strategies that could alleviate/cure Alzheimer’s disease. Recent studies have shown that inhibiting BACE1 activity with synthetic compounds helped to slow or arrest Alzheimer’s disease symptoms. BioVision’s BACE1 Assay Kit II provides a fast and easy method for measuring BACE1 activity in a variety of samples. In this kit, a secretase-specific peptide is conjugated with two reporter molecules, EDANS and DABCYL. In the uncleaved form, the fluorescent emissions from EDANS are quenched by the physical proximity of the DABCYL moiety. Cleavage of the peptide by BACE1 separates EDANS and DABCYL groups allowing for the release of a strong fluorescent signal (Ex/Em= 345/500 nm). The level of secretase activity in samples is proportional to the level of fluorescence intensity. The assay is simple, sensitive, high-throughput adaptable and can detect BACE1 activity as low as 0.2 µM per sample.

II. Application:
- Measurement of BACE1 activity in various tissues/cells
- Analysis and mechanistic study the Alzheimer’s disease
- Screening potential therapeutic compounds for Alzheimer’s disease

III. Sample Type:
- Animal tissues: Brain and Liver, etc.
- Cell culture: Adherent or Suspension Cells

IV. Kit Contents:

V. User Supplied Reagents and Equipment:
- 96-well white plate with flat bottom
- Multi-well spectrophotometer (ELISA reader)

VI. Storage, Handling and Reagent Preparation:
Store kit at -20°C, protected from light. Warm BACE1 Extraction Buffer and BACE1 Assay Buffer to room temperature before use. Briefly centrifuge small vials prior to opening.

- BACE1 Extraction and BACE1 Assay Buffer: Warm to room temperature before use. Store at 4°C.
- BACE1 Substrate, EDANS Standard and BACE1 Inhibitor Control: Thaw to room temperature. Ready to use. Store at -20°C. Use within two months.
- Active BACE1: Keep on ice while in use. Aliquot and store immediately at –70°C. Use within two months.

VII. BACE1 Activity Assay Protocol:
1. Sample Preparation:
- Cells or tissue lysate: rapidly homogenize tissue (10 mg) or cells (10 x 10⁶) with 500 µl ice-cold BACE1 Extraction Buffer, and place on ice for 10 minutes. Centrifuge at 10,000 x g for 5 min at 4°C and collect the supernatant. Use saturated ammonium sulfate to precipitate proteins and remove interferences such as small molecules: Aliquot homogenized samples (100 µl) to a clean centrifuge tube, add saturated 4.32 M ammonium sulfate (BioVision Cat. # 7096) bringing saturation to 65% (1 volume of sample + 2 volumes of 4.32 M ammonium sulfate). Place on ice for 30 mins. Spin down samples at 10,000 x g at 4°C for 10 mins, discard supernatant, and resuspend the pellet back to the original volume with BACE1 Assay Buffer. Add 2.5 µl samples into a 96 well white plate; adjust final volume to 50 µl with BACE1 Assay Buffer. BACE1 Positive Control: add 2-5 µl of BACE1 Positive Control into wells and adjust final volume to 50 µl with BACE1 Assay Buffer.

Notes:
- For unknown samples, we suggest testing several doses to ensure the readings are within the standard curve range.
- For unknown samples or samples exhibiting high background, prepare parallel sample well(s) as sample background controls.

2. EDANS Standard Curve: Dilute EDANS Standard to 10 µM by adding 10 µl of 100 µM EDANS to 90 µl BACE1 Assay Buffer. Add 0, 2, 4, 6, 8 and 10 µl of diluted 10 µM EDANS Standard into a series of wells to generate 0, 20, 40, 60, 80 and 100 pmol/well of EDANS Standard. Adjust volume to 100 µl/well with BACE1 Assay Buffer.

3. Reaction Mix: Mix enough reagents for assays to be performed. For each assay, prepare 50 µl Mix containing:
Add 50 µl of the Reaction Mix to each well containing test samples and BACE1 Positive Control well(s). * For unknown samples or samples with high background, add 50 µl of Background Control Mix in a duplicate well.

4. **Measurement**: Measure the plate immediately at Ex/Em= 345/500 nm in kinetic mode for 10-60 min at 37°C.

**Note**: Incubation time depends on the BACE1 activity in the samples. We recommend measuring absorbance in kinetic mode, and choosing two time points (t₁ & t₂) in the linear range to calculate the BACE1 activity of the samples. If low activity is expected, longer incubation times may be needed. The EDANS standard curve can be read in Endpoint mode (i.e., at the end of incubation time).

5. **Calculation**: Subtract the 0 standard reading from all standard readings. Plot the EDANS standard curve. Correct sample background by subtracting the value derived from the background control from all sample readings if necessary. Calculate the BACE1 activity of the test sample: \( \Delta RFU = RFU_2 - RFU_1 \). Apply the \( \Delta RFU \) to the EDANS standard curve to get B pmol of EDANS generated by BACE1 during the reaction time (\( \Delta t = t_2 - t_1 \)).

\[
\text{Sample BACE1 Activity} = B(\Delta V X D) = \text{pmol/min/µl} = \text{µU/µl} = \text{mU/ml}
\]

Where:
- B is the EDANS amount from standard curve (pmol)
- \( \Delta t \) is the reaction time (min)
- V is the sample volume added into the reaction well (µl)
- D is the dilution factor

Unit Definition: One unit of EDANS is the amount of enzyme that will generate 1.0 pmol of EDANS per min at pH 4.5 at 37°.

**Figure**: (a) EDANS Standard Curve. (b) Kinetic measurement of BACE1 activity in mouse whole brain lysate (4 µg). (c) Relative BACE1 Activity was calculated in lysates (4 µg) prepared from mouse whole brain (Sample 1) and mouse whole brain (Sample 2). Assays were performed following kit protocol.
