

Active PAD4, Human Recombinant

03/21

CATALOG NO:	P1720-50 50 µg P1720-100 100 µg
ALTERNATE NAMES:	Peptidyl Arginine Deiminase 4; PDI5; HL-60 PAD; PADI5; PDI4; PAD; PADI4
MOL. WT.	75.8 kDa
NCBI GENE ID:	23569
ACCESSION NO.:	Q9UM07
PURITY:	≥ 85% by SDS-PAGE
SOURCE:	<i>E. coli</i>
AMINO ACID SEQUENCE:	Full length human PAD4 protein (amino acids 2 to 663) with N-terminal His tag
SPECIFIC ACTIVITY:	Activity output measured by the production of ammonium ions when enzyme acts on N-benzoyl-L-arginine ethyl ester (BAEE) substrate
FORM:	Liquid
FORMULATION:	50 mM HEPES, pH 8.0, 300 mM NaCl, 1 mM DTT, 10% glycerol
STORAGE CONDITIONS:	Upon receipt, aliquot and store at -80 °C. Avoid repeated freeze-thaw cycles.

DESCRIPTION: Protein arginine deiminases (PADs) are a family of guanidine-modifying enzymes that catalyze the post-translational modification of target proteins by converting arginine to citrulline. Excessive citrullination of proteins may result in disease states. PAD4 (also known as PADI5) is expressed in neutrophils and in a variety of tissues. PAD4 is known to citrullinate histones, which initiates chromatin decondensation in neutrophils and the subsequent release of neutrophil extracellular traps (NETs), which leads to a lytic form of cell death known as NETosis. The presence of serum PAD4 autoantibodies has been associated with rheumatoid arthritis.

Various amounts of Active Human Recombinant PAD4 was loaded on SDS-PAGE under reducing conditions and visualized by Coomassie blue stain.

Active Human Recombinant PAD4 activity can be inhibited by Cl-Amidine (Cat. No. B2802). Fluorescence output is inversely proportional to the amount of citrullination by PAD4.
